How a 5G base station has changed the performance of a base station?

To meet the communication requirements of large capacity and low delay, the commissioning of new equipment has significantly improved the performance of 5G base stations compared with the previous generation base stations. At the same time, the new equipment has altered the power load characteristics of base stations.

What is a 5G base station energy consumption prediction model?

According to the energy consumption characteristics of the base station, a 5G base station energy consumption prediction model based on the LSTM network is constructed to provide data support for the subsequent BSES aggregation and collaborative scheduling.

Does 5G support centralized regional protection services?

The integration of new energy sources has led to bidirectional power flows in distribution grids. Investigating delay characteristics in 5G networks is crucial for supporting centralized regional protection services in these grids. This study analyzes inherent, NR,...

How to calculate 5G NR delay?

The NR delay refers to the delay of the transmission from the CPE to the base station. The uncertainty of the NR Delay, uplink and downlink slot ratio, and retransmission are the main differences between wired and wireless communications. According to the 3GPP standard, the 5G NR Delay can be calculated using 
$$T_{\{2\}} = T_{\{t\}} + T_{\{s\}} + T_{\{a\}}$$

In this context, we propose a Delay-aware and Energy-efficient Integrated Optimization System (DEIS) based on Deep Reinforcement Learning (DRL), which jointly ...
