---

future (const future & ) = delete; ~future (); future & operator =(const future & ) = delete; future & operator =(future & & ) noexcept; shared\_future <R> share () noexcept; // ...

The get member function waits (by calling wait ()) until the shared state is ready, then retrieves the value stored in the shared state (if any). Right after calling this function, valid ...

Unlike std::future, which is only moveable (so only one instance can refer to any particular asynchronous result), std::shared\_future is copyable and multiple shared future ...

The class template std::future provides a mechanism to access the result of asynchronous operations: An asynchronous operation (created via std::async, ...

If the future is the result of a call to async that used lazy evaluation, this function returns immediately without waiting. The behavior is undefined if valid () is false before the call ...

If the future is the result of a call to std::async that used lazy evaluation, this function returns immediately without waiting. This function may block for longer than ...

Specifies state of a future as returned by wait\_for and wait\_until functions of std::future and std::shared\_future. Constants

Checks if the future refers to a shared state. This is the case only for futures that were not default-constructed or moved from (i.e. returned by std::promise::get\_future (), ...

Transfers the shared state of \*this, if any, to a std::shared\_future object. Multiple std::shared\_future objects may reference the same shared state, which is not possible with ...
