For Linux `<code>defunct</code>` and `<code>zombie</code>` processes are the same. From `man ps`: Processes marked `<code>defunct</code>` are dead processes (so-called `<code>zombies</code>`;) that remain because ...

On one particular system we see WIS-Streamer get stuck in an `TASK_UNINTERRUPTIBLE` state; From the command line: the `ps` status for the process is ...

I have a VirtualBox process hanging around which I tried to kill (`KILL/ABORT`) but without success. The parent pid is 1 (`init`). `top` shows the process as `D` which is documented as ...

As you could read from that answer, setting the current process state to `TASK_UNINTERRUPTIBLE` is needed for make `schedule()` call, performed by that thread, to ...

A process performing I/O will be put in `D` state (uninterruptable sleep), which frees the CPU until there is a hardware interrupt which tells the CPU to return to executing the ...

When looking at the process with `<code>ps ax</code>` the `stat` column is `<code>Dl</code>` which means `<code>uninterruptible sleep (usually IO)</code>`. Is it possible to find out more details on what the process is ...

Generally speaking, uninterruptible sleep states are considered undesirable. Under normal circumstances, they cannot be triggered by user applications except by accident (e.g. ...

An uninterruptible process is a process which happens to be in a system call (kernel function) that cannot be interrupted by a signal. To understand what that means, you ...

I understand these are uninterruptible sleep states often related to waiting for data from hardware such as a
